

Coffe Hub

25424971¹

1. Introduction

This sections explores the potential coffee distributors for a coffee shop in Stellenbosch. The cost (in USD), the roaster company, the roast strength, and reviews of the coffees are considered.

I view the data:

2. Average Rating and Price

2.1. Average Rating and Price by Roaster Location

The plot below indicates that Australia and England are clear outliers. Although roasters in these countries have, on average, the highest ratings, all the countries receive an average rating of 90 or above. I would suggest that the prices disqualify the further consideration of Australian and English roasters.

Figure 2.1: Average Rating and Price by Roaster Country.

2.2. Average Rating and Price by Roaster Location, excluding Outliers

Ratings cluster between 92 and 94, however, outliers in price remain.

Figure 2.2: Average Rating and Price by Location of Roaster without Outliers.

2.3. Average Rating and Price by Roast Level

Light roast has the highest average rating, but also the highest average cost. Dark has the lowest average rating and the lowest cost. Medium-light and medium roast offer a middle-ground.

Figure 2.3: Average Rating and Price by Roast Level.

3. Indicator words

Wrangle the data using a function:

3.1. Average Rating and Price by Review Indicator Words

This plot indicates that coffee brands that have reviews describing the aroma and chocolatiness of the coffee are the best deal when it comes to the ratings-price relationship. Subsequent analysis will be focused on these observations.

Figure 3.1: Average Rating and Price by Review Indicator Words.

3.2. Boxplot by Country and Roast Level

The goal is to trim the most expensive coffee products. Boxplot shows the outliers in red. The boxplot also illustrates that Taiwan and the US are the have the most roasters.

Figure 3.2: Price by Country and Roast level.

3.3. Price Distribution

The distribution in price aids in determining where a hard cap on the price should be. At USD8 per 100 grams, there is a fall in the number of coffee products sold at this price, and provides a reasonable cap.

Figure 3.3: Price Distribution.

3.4. Tile Plot

This plot depicts the average ratings by roaster and roast level once the coffee products that have a cost larger than USD8 and roasters that only supply one remaining product have been filtered out. The reasoning is that a distributor can provide a diversified selection of products.

Figure 3.4: Average Rating by Roaster and Roast Level.

3.5. Prices and Ratings for Roasters

The plot below displays the price-ratings relationship for narrowd-down roasters. Kakalove Cafe seems to be a promising supplier, with most of its product prices falling the lowest, and receiving the highest some of the highest ratings. They also produce a variety of products.

Figure 3.5: Ultimate Prices and Ratings.
